3. analogy

// design instruments
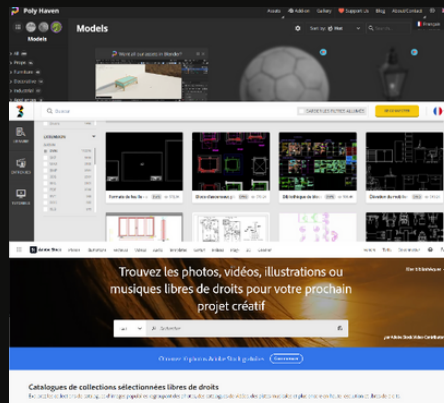

|	**target domain**	**source domain**
problem	asset library	autonomous system
solution	centralised asset library	object detection

Architects often rely on premade assets for their production, they can be a 2D vector drawing, 3D drawing, PNG images, render materials, BIM object's definition, etc.... The official office asset library is usually poorly managed and finding the right asset between all the different offers online can be a hassle as there are many different offers online. It can also be painful to find matching assets between the different formats, for example if you need the same chair in 2D, 3D, and PNG.

centralised asset library for architects

Crafted for architects, designers, and firms that often find themselves wading through heaps of assets to find the right fit. This library can quickly group similar design pieces together, making searching for specific assets in different formats much faster and easier without having to switch platforms or do additional work. The benefits encompass time savings, better design quality, and cost-efficiency.
